Automic and DBmaestro integration:

End-to-end
continuous delivery

Combine Automic's business automation expertise and DBmaestro's database DevOps capabilities to automate database builds and merge them into application deployment pipelines, all the way to production.
Databases are a critical component of business intelligence, development and test stages within the application lifecycle. The new DBmaestro Database DevOps Action Pack ensures automated, continuous delivery across all environments, enabling customers to operate agile automated release pipelines through testing and production with absolute confidence and control.

Key capabilities:

Out-of-the-box integration enables users to include creation, execution and rollback of DBmaestro interactions as an integral part of the application release automation model.

Produce a complete audit trail for your database changes; easily monitor activities, knowing who did what, when and why.

Automate validity checks as part of a safe, automated release pipeline. Prevent accidental overrides, get alerts about configuration drift and automatically stop your release process when needed.

Increase agility of development test-and-release process by supporting automation of sophisticated workflows for domains, repositories, integration services and the administration console.

Enforce organizational roles and policies – grant and control access to each organizational role, while making sure non-policy actions or changes are reported or blocked.

Leverage a DevOps scorecards, so you can improve deployment frequency, recognize failure trends, analyze change volume, lead time, mean time to recovery and more.
